

This is a grocery ordering system for a supermarket chain that allows:

1. **Customers** to go shopping online and make orders
2. **Administrators** to get an overview of all the customers

When launching the application, user should choose to login as a customer or an administrator.

If the user decided to login as customer, he will be redirected to the customer login page. If this is a new customer, he will have to create to a new account. Once he is registered, he will be able to login.

On the login page, user has to enter username and password, once confirmed, he will be redirected to the customer page -- a home page like Amazon's but only allows the user to order groceries online, nothing else than groceries.

On the graphical interface for the customers, the customer can

1. Search items by names
2. View all the items that he has already bought before
3. View the status of all the items that he has ordered
 - a) Ordering by date or ordering by price
4. Choose a store and views or the items for sales of the chosen store
5. Add item(s) to a shopping cart
6. Modify the shopping cart
 - a) Clear shopping cart
 - b) Change quantities of an existing item in the list to buy
 - c) Delete item(s) in the shopping cart
7. Logout -- once the customer has logged out, he will be redirected to the
